- Title:

EP0838737A1: Means for identifying a manual action on a surface, in particular for a time piece[German][French]
- Derwent Title:

System for identification of a manual action on a touch sensitive surface - comprises assembly of detectors each capable of activation by the finger, etc. [Derwent Record]

- Priority Number:

1996-10-25 FR1996000013061
- Abstract:

System for identification of a manual action on a touch sensitive surface The device for detection of a finger pressed on a surface, which is comprised of an assembly of detectors (41), each being capable of activation by the said finger which causes a change in an electric quantity of the detectors (41). The detectors are laid out together so that they correspond to surface zones. Detection means (42) are provided to determine which detector (41) amongst an array of detectors which are simultaneously activated has the greatest variation in electrical quantity. Means for conversion of the electrical quantity of the detectors to a signal the frequency of which is proportional to the input electrical quantity. [French]

First Claim:  
[Show all claims](#)

1. Dispositif destiné à identifier une action manuelle faite par un doigt (32) sur une surface, comprenant :

- un ensemble de capteurs (41) susceptibles d'être activés chacun par ledit doigt (32) de manière à engendrer une variation d'une quantité électrique, ces capteurs étant agencés respectivement à l'intérieur d'un ensemble correspondant de zones déterminées de ladite surface; caractérisé en ce que ledit dispositif comprend en outre
- des premiers moyens (42) de détection, parmi un sous-ensemble desdits capteurs (41) qui sont activés simultanément, du capteur activé présentant la plus grande variation de ladite quantité électrique.

Description

[Expand description](#)

La présente invention concerne un dispositif d'identification d'une action manuelle faite par un doigt sur une surface et, plus particulièrement, elle concerne un tel dispositif comportant un ensemble de capteurs susceptibles d'être activés chacun par le doigt d'un utilisateur de manière à engendrer une variation d'une quantité électrique. Un tel dispositif peut être utilisé dans des applications horlogères, telle qu'une montre-bracelet comprenant un dispositif de reconnaissance de caractères tracés à la main sur le verre de la montre. On comprendra toutefois que l'invention n'est pas limitée à cette application.
